

Diet modifies the fat body transcriptional response to infection

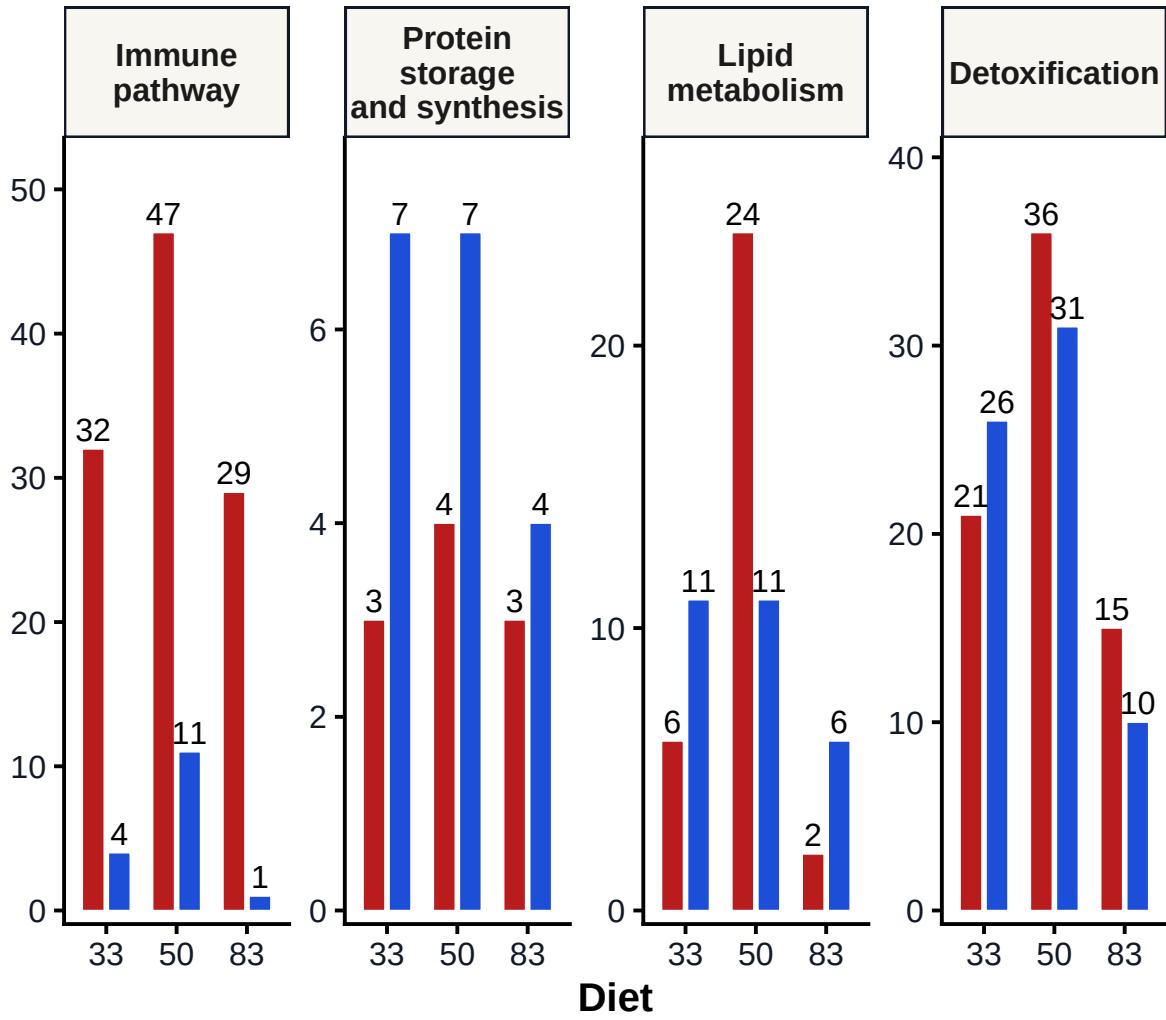

Focused on immune pathway, protein storage and synthesis, lipid metabolism, and detoxification candidate DEGs

A

Diet-specific infection-response DEGs

Counts are significant infected-vs-control DEGs within each diet

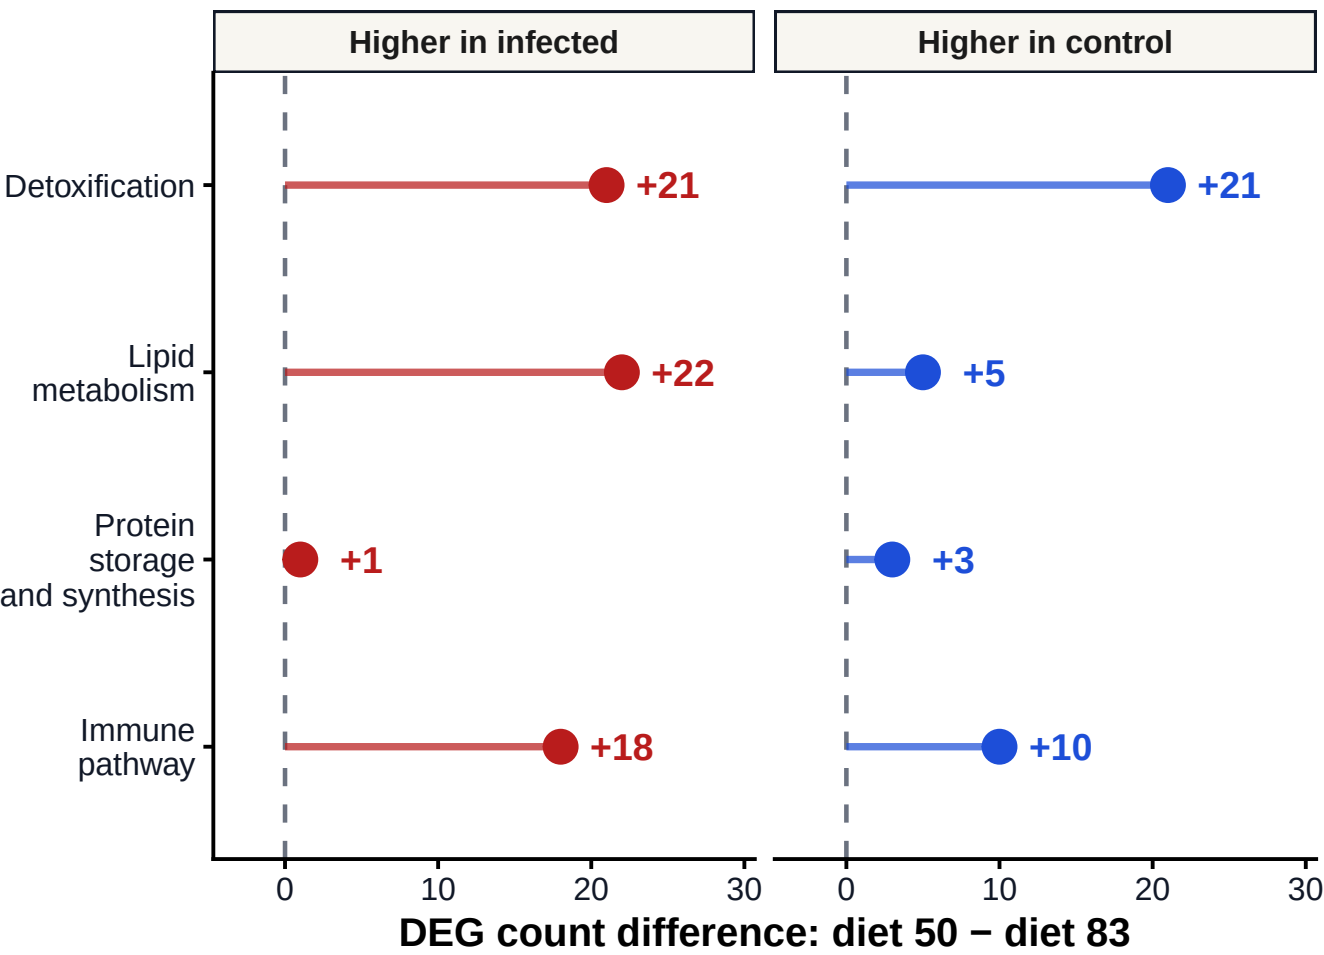

Number of DEGs

B

Diet 50 versus diet 83

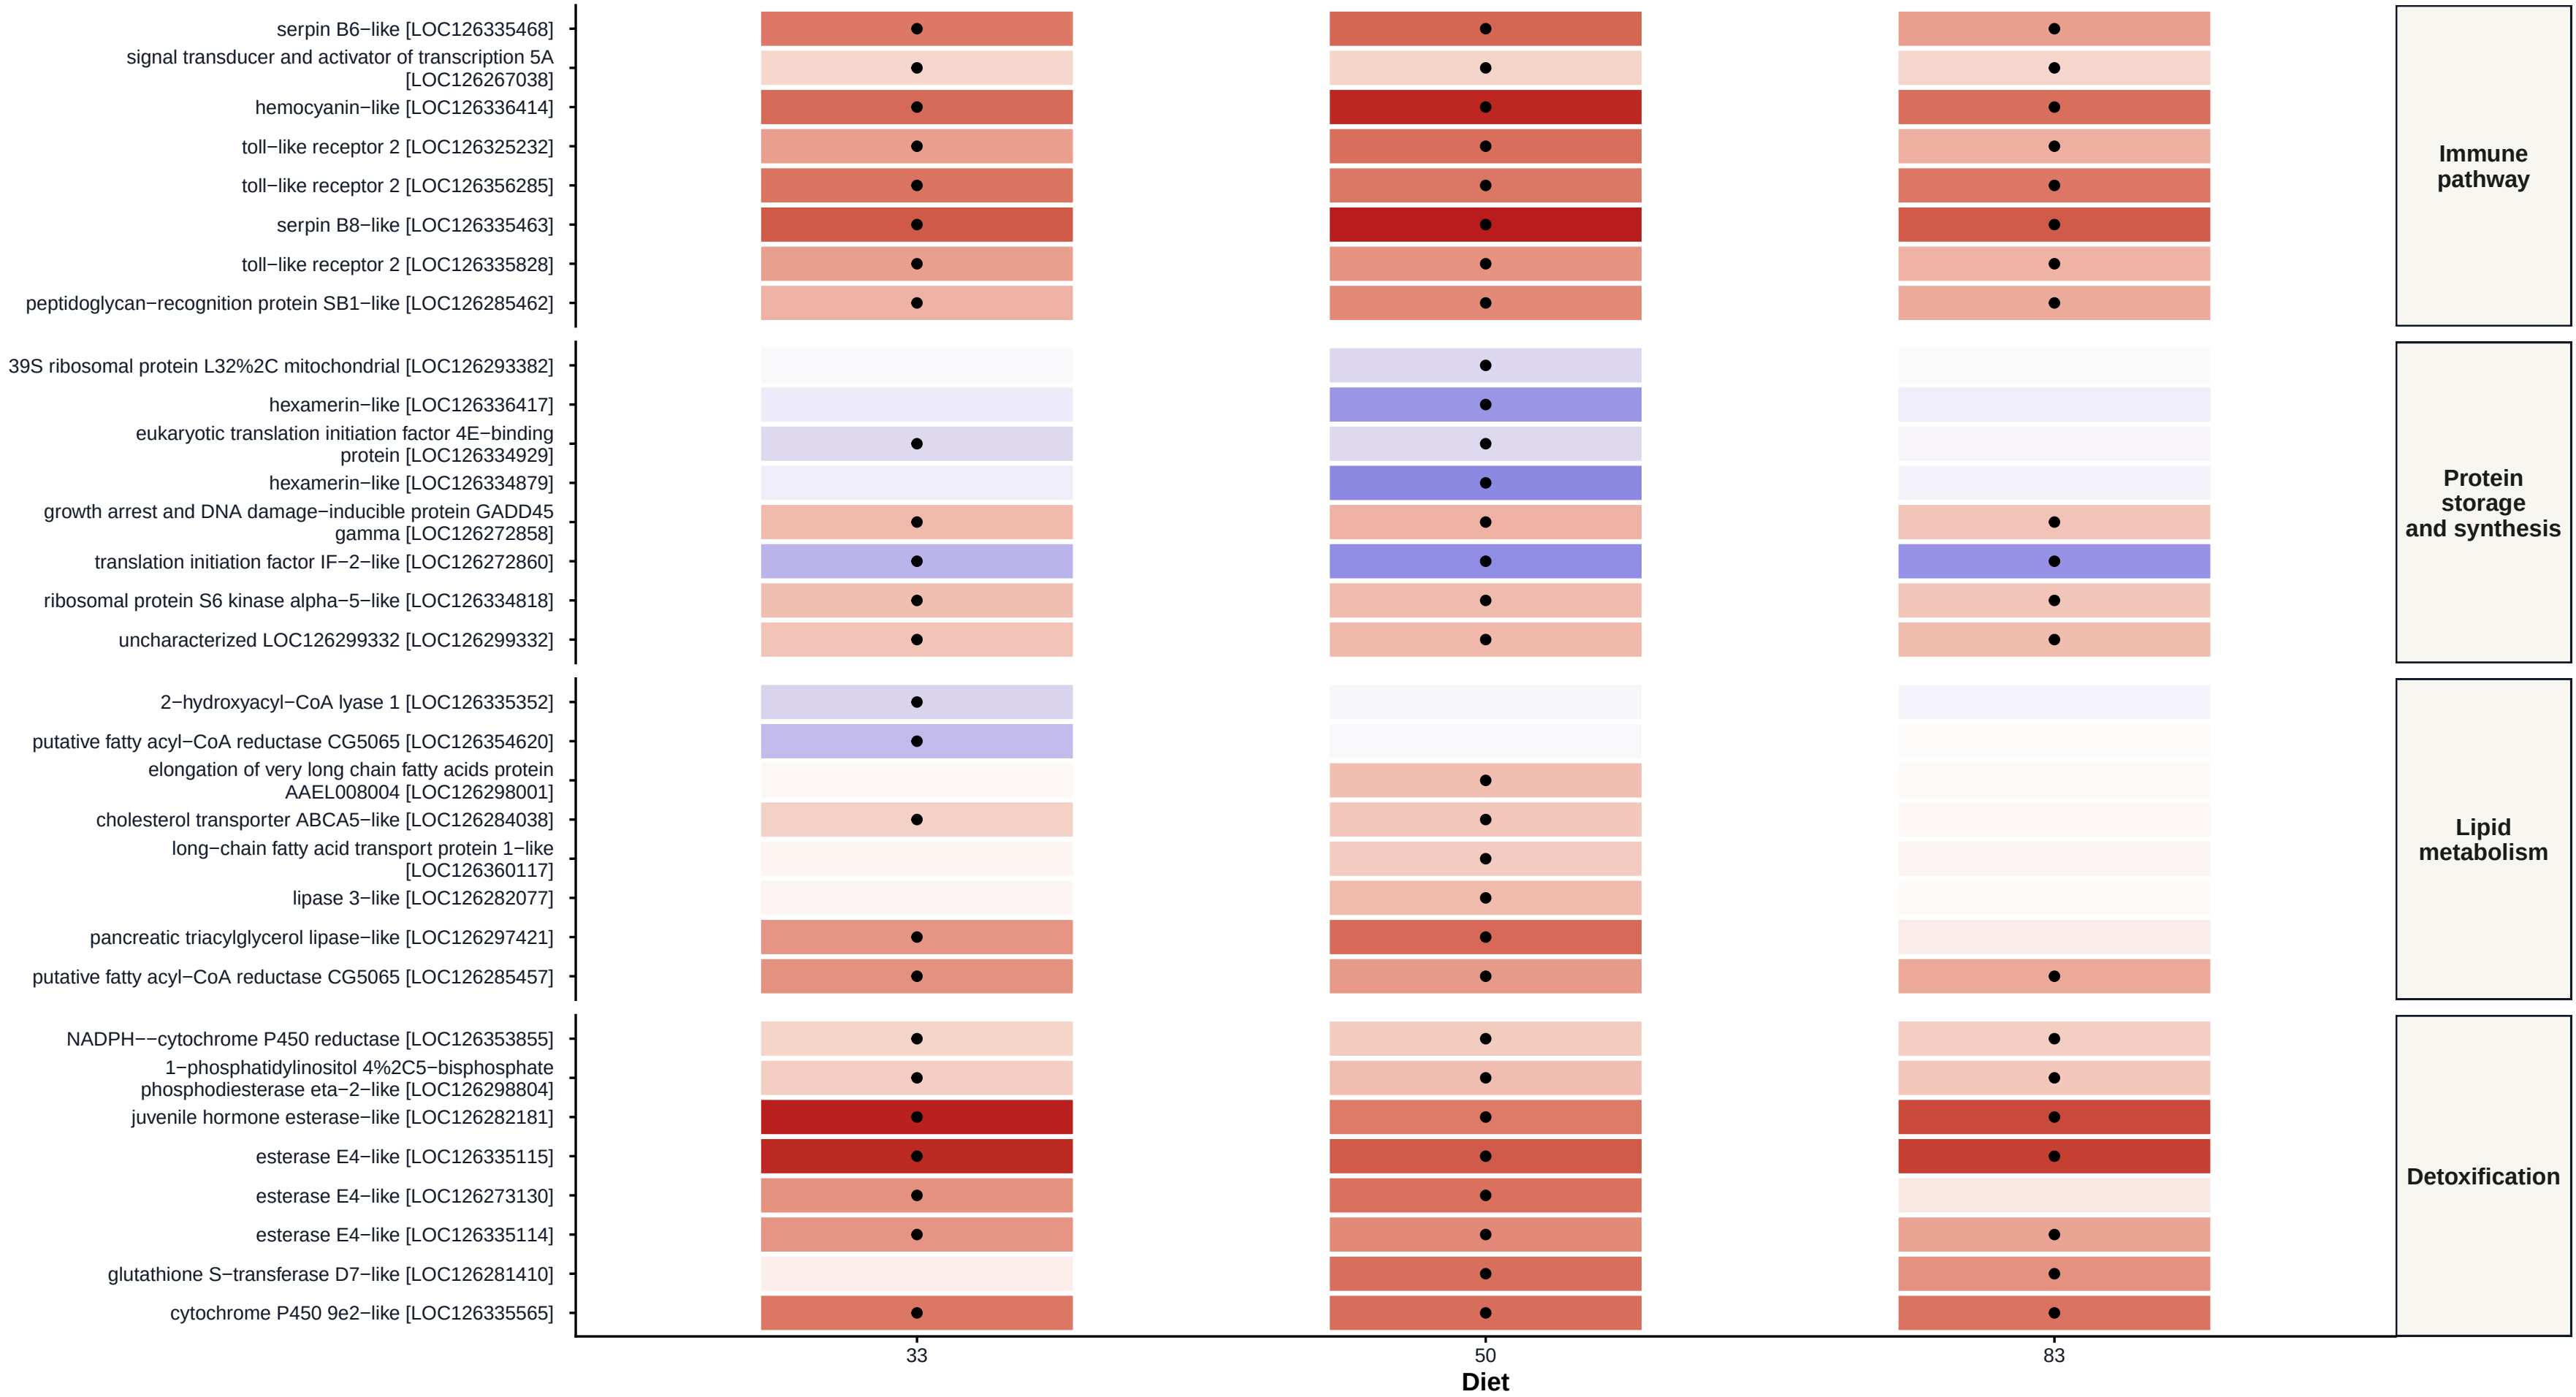

Positive values mean more infection-response DEGs in diet 50; negative values mean more in diet 83

C

Candidate genes driving diet-specific infection responses

Black dots mark diet-specific significant DEGs; tile color shows infection log2FC in every diet

Direction Higher in infected Higher in control

Infected vs control log2FC
